The aim of this research is to determine whether the research objects are located in Kebondalem village, Kademangan village, Mojoagung district, which is one of the villages that are often hit by floods when the rainy season arrives

This study uses a qualitative approach. Case studies are conducted where there are frequent floods in this area caused by a fairly high intensity of rainfall and this region is passed by three river streams, data used is obtained from the field as well as literature studies using a method of data collection.

The results of the research show that comparison results from the calculation of flood discharge after 10 years and the results of existing channel crossing, installation of Flood Warning Alarm location post, participation of the community in flood mitigation in the village of Kademangan Prefecture Mojoagung district Jombang.

Keywords : Community Participation, Reducing Flood Risk, Mitigating, Flood Warning Alarm
